ESDS · SUTR · SECTOR-WISE BUSINESS CASE

Business Use Case / Business Model

Sutr turns an organisation's existing APIs and business systems into secure, governed, deployable AI capabilities – without building and maintaining every AI integration from scratch.

Positioning 01

WHAT THE CUSTOMER IS BUYING — NOT MCP

- **Faster AI deployment** — AI assistants reach live systems in weeks, not per-project build cycles.
- **Lower integration effort** — existing APIs are reused; no integration layer rebuilt per AI application.
- **Controlled access** — the organisation decides what AI can read, change or never touch.
- **Workflow automation** — manual cross-system work becomes an AI-assisted workflow.

WHY IT IS MORE THAN AN API CONVERTER — THE FULL LIFECYCLE

Build OpenAPI / Swagger / Postman / Git → tools	**Secure** Credentials hidden from AI, RBAC, allow · approve · deny per tool	**Deploy** Customer's cloud, ESDS DC or self-hosted
Connect One MCP endpoint for any AI client	**Monitor** Audit log, usage, failures, metering	**Maintain** Versions, rollback, API drift detection

These capabilities apply to every sector below and are not repeated there — each sector lists only what matters most to it.

> WEAK PITCH
>
> "Sutr is an API-to-MCP converter that generates MCP servers and deploys them on cloud." — sounds like a developer utility; invites "why pay?"

> STRONG PITCH
>
> "Sutr makes your existing APIs and systems AI-ready — build, secure, deploy and monitor AI integrations on one platform, faster and under your control."

Who buys 02

STAKEHOLDER	CARES ABOUT	SUTR'S MESSAGE
CIO / CTO	AI adoption, integration cost, scalability	One platform to operationalise AI integrations organisation-wide
Head of Engineering / Platform	Developer productivity, deployment, maintenance	Build, deploy and version integrations without repeated custom work
CISO / Compliance	Credentials, access control, auditability, data exposure	Govern exactly how AI applications reach enterprise systems
Business / Operations Head	Turnaround time, productivity	AI connected to workflows that are manual today

Same platform, different reason to buy — tailor the opening to the person in the room, never one technical explanation for all.

Sector-wise use of Sutr 03

A Cloud & IT infrastructure providers – incl. ESDS

INITIAL FOCUS

USE CASES

- AI cloud-ops assistant — unhealthy VMs, anomalies, remediation plan
- AI-assisted provisioning of approved environments
- Support automation — explain a customer's service outage from resource status
- Internal AIOps — recurring-incident summaries

WHY SUTR HERE

- Hundreds of APIs, many AI initiatives — one central layer instead of per-team stacks
- Integrations run on the provider's own cloud
- Creates sellable AI-enabled cloud services from APIs that already exist

> *"Your infrastructure APIs can power AI-driven operations. Sutr is the secure layer that exposes them to enterprise AI assistants."*

APPROACH CTO · Head of Cloud Platform · Head of AIOps · Product Head

B IT services & system integrators

INITIAL FOCUS

USE CASES

- Integration factory — build a CRM/ERP integration once, redeploy per client
- Internal developer platform — import spec, generate, test, deploy to client environment
- Managed AI-integration services inside existing managed-services contracts

WHY SUTR HERE

- Reusable, versioned integrations become the SI's own IP
- Per-client isolation and multi-environment deployment
- Lower engineering effort per project → better delivery margin

> *"Your teams keep rebuilding the same AI integrations for each client. Sutr turns that into a repeatable workflow."*

APPROACH Head of AI Practice · Cloud Practice Head · Delivery Head

C SaaS & software product companies

INITIAL FOCUS

USE CASES

- Offer the product's own MCP endpoint (CRM, HR, project, accounting, DevOps SaaS)
- Let customers' AI assistants query and act inside the product

WHY SUTR HERE

- Hosted MCP offering without building the stack
- Tenant-level isolation for their customer base
- Metering + registry enable a premium "AI access" tier

> *"Your SaaS already has APIs. Sutr turns them into a managed MCP offering your customers can use from any AI assistant."*

APPROACH VP Engineering · Head of Platform · Product Head

D BFSI – banks, NBFCs, insurance, fintech

NEXT

USE CASES

- Relationship-manager assistant — customer summary, open requests, eligible products
- Loan operations — status, missing documents, follow-up task
- Claims assistant — pending documents, drafted customer response
- Risk/compliance research — policy lookup, case status, review summary

WHY SUTR HERE

- Human approval on sensitive actions, pinned to the exact parameters approved
- Private deployment — core systems never exposed to external AI platforms
- Per-action evidence for internal audit

> *"Make your systems usable by AI without giving AI unrestricted access to core infrastructure."*

Caveat: never promise regulatory compliance — it depends on the customer's architecture, controls and data handling. APPROACH CIO · Head of Digital · Head of Operations · CISO

E Manufacturing & industrial

NEXT

USE CASES

- Predictive maintenance — recurring alerts, history, work order
- Production — output vs plan, delayed work orders
- Inventory/procurement — below-threshold stock, purchase request
- Quality — recurring incidents per line

WHY SUTR HERE

- Read-only on OT/SCADA; actions only in ERP and maintenance systems
- Keeps AI away from direct control of critical equipment

> *"An AI interface to your ERP, maintenance, inventory and monitoring systems – investigate and act through approved workflows."*

Caveat: direct AI control of machinery is out of scope — separate, high-risk safety problem. APPROACH Head of Digital · Plant CIO · Operations Head

F Healthcare & hospitals

LATER

USE CASES

- Administration — appointments, cancellations, department summary
- Patient support — appointment and insurance request status
- Billing/claims — pending documentation, follow-up tasks

WHY SUTR HERE

- Data minimisation — AI sees only the fields a tool exposes
- Administrative and clinical workflows kept separate
- Works over existing HIS/EMR — no system replacement

> *"Staff get approved information and automated admin workflows from the hospital systems you already run."*

Caveat: clinical decision support needs separate validation and professional oversight. APPROACH CIO · Hospital IT Head · Digital Health Head

G Logistics & supply chain

LATER

USE CASES

- Delayed shipments — status and customer notification
- Fleet — maintenance alerts to service requests
- Warehouse — inventory discrepancies, pending tasks

WHY SUTR HERE

- Fragmented TMS/WMS/fleet/partner APIs behind one endpoint
- Drift detection when carrier or partner APIs change

> *"One AI-accessible workflow layer over your fragmented operational systems."*

H Retail & e-commerce

LATER

USE CASES

- Support — order status, delay reason, drafted reply
- Inventory — low stock across warehouses
- Operations and marketing — escalations, campaign summaries

WHY SUTR HERE

- New SaaS tools added often — 48 prebuilt integrations plus spec import
- Onboarding a new system is configuration, not a project

> *"Automate commerce, inventory and service tasks using the APIs you already have."*

Market-entry sequence

04

Target where three conditions hold: **APIs already exist**, **multiple systems must work with AI**, and **deployment and control matter**.

PRIORITY	SECTOR	REASON FOR THE RANKING
INITIAL	Cloud providers / ESDS	Direct fit; ESDS owns the APIs and the infrastructure
INITIAL	IT services / SIs	Repeated integration work; each SI multiplies reach across clients
INITIAL	SaaS companies	APIs ready; short, engineering-led buying cycle
NEXT	BFSI, manufacturing, enterprise IT	High-value workflows; longer security and procurement cycles
LATER	Healthcare, logistics, retail	Clear use cases; uneven integration and compliance complexity

A sequence based on product fit and sales complexity — not a judgement of which sector is worth more.

ESDS play: own services via MCP + ML engineering agent

05

OFFER	WHAT IT IS	REVENUE EFFECT
ESDS services as AI tools	Cloud, managed services, SOC, DR, backup and billing APIs exposed to customers' AI assistants	Attach line on existing contracts; ticket deflection
Managed MCP service	ESDS hosts and operates customers' own AI integrations in ESDS data centres	Recurring managed-services revenue + infrastructure consumption
ML engineering agent + app integration	ESDS's coding agent reaches data, GPUs, experiment tracking and deployment through Sutr, never holding credentials	Highest-value bundle: agent seats + GPU hours + platform

> "For ESDS, Sutr is the AI integration layer over existing cloud and enterprise APIs – enabling AI-assisted cloud operations, AIOps, support automation and managed MCP services for enterprise customers."

Business model

06

THREE WAYS TO SELL

MODEL	CUSTOMER	THEY BUY	PITCH
Developer / platform product	IT teams, SaaS companies	Platform to build, deploy and manage integrations	Less engineering to make APIs AI-usable
Enterprise AI integration platform	BFSI, manufacturing, healthcare	Governed layer between AI and business systems	AI on your systems, control retained
Managed MCP / AI infrastructure	Cloud providers, SIs, ESDS customers	Hosted, operated integrations and endpoints	Offer AI integrations without running the stack

REVENUE LINES — indicative, validate against ESDS price book

LINE	CHARGED ON	INDICATIVE
Platform subscription	Per organisation, tiered by tools and tenants	`₹12–60 L / yr`
Usage	Tool calls beyond tier allowance	`Per call`
Integration services	One-time, per system onboarded	`₹2–8 L`
Managed operation	ESDS runs, patches and holds the SLA	`₹1.5–4 L / month`
Partner / SaaS revenue share	Share of MCP access sold via the registry	`15–20%`
ML agent bundle	Seats + GPU hours	`Per seat + GPU-hr`

LAND → EXPAND paid pilot on one system → annual subscription → more systems and managed operation → ML agent bundle.

How to sell 07

PITCH FORMULA

`Existing problem` → `Business workflow` → `Sutr capability` → `Business outcome`

THE 30-SECOND PITCH

> "Most enterprises already have hundreds of APIs, but connecting them to AI assistants means custom integrations, authentication, deployment and maintenance. Sutr is one platform to make those systems AI-accessible – secured, deployed in your environment and monitored – without rebuilding the integration layer for every AI application."

SALES MOTIONS

MOTION	HOW
ESDS install base	Account managers attach Sutr to existing cloud and managed-services customers — no new vendor onboarding
Paid pilot	Fixed scope: one system, one AI assistant, governance configured, results reviewed
SI partnerships	SIs deliver Sutr inside their AI projects; ESDS earns platform and hosting
Government / PSU	GeM listing and tenders via SI partners
Developer-led	Open-source self-hosters convert to paid when security or scale requires it

DO NOT PROMISE YET

ITEM	STATE
ESDS service tools	Needs documented APIs from each ESDS product team
Performance figures	Not benchmarked — no latency/throughput numbers in proposals
Per-tenant Kubernetes runtime isolation	Built, not tested on a live cluster
External billing / payouts	Metering and ledger built; no payment gateway connected
ML engineering agent	In development — sell as roadmap, not product
